

DatCon-1 fork by yvonperr

=====

Please use the following java command line:

```
java -jar <path-to-jar-directory>/DatCon.jar -i  
<path-to-dat-files-directory>/ -w -=
```

My modified DatCon will open up a **separate** interface window **for each .dat file** it finds in the given files directory and any subdirectories there.

Upon completion you will have, in each specified directory containing input .dat files, a new output FLYxxx.csv file, a new output FLYxxx.DAT.LOG file, and an open user interface window for **each file processed** so that you, the user, can read the process feedback (success/failure, etc.) in each individual process window's bottom panel. Of course you can also simply read the appropriate FLYxxx.DAT.LOG file.

Good luck!
